

SecureTide™ is AppRiver's fully managed email protection service, eliminating up to 99% of unwanted email before it reaches a user's network. It is a powerful and flexible service that enables organizations of any size to manage email communications with the same level of control and protection as the Fortune 500. No hardware or software is required and a Free 30 Day Trial is included.

Inbound and Outbound Email Protection

The SecureTide filtering system is continually revised 2,000-4,000 times per day to ensure protection from even the newest Spammer tricks and tactics. It works on multiple platforms and utilizes proprietary detection systems, 4 virus scanning engines, more than 60 filtering techniques, and front-wave protection to rid inbound and outbound email from spam, worms, viruses and all other protocol-based vulnerabilities.

Disaster Recovery

If a client-side server is not accepting email for any reason, such as Internet connection failures, power outages, natural disaster, Local Area Network failures, internal routing problems, mail server hardware or software failures, SecureTide's delivery manager will encrypt and queue email until the client server is back online.

Perimeter Protection

SecureTide acts as an organization's gated "front door," shielding Internet facing SMTP gateways and message servers from numerous threats so that only legitimate e-mail is delivered to user's inboxes.

Implementation

Complete implementation of the AppRiver SecureTide system can be achieved in just one day. As an ASP solution, there is no hardware or software required. Successful implementation is as simple as changing MX records within your DNS for each domain that requires filtering services.

"The product's Web-based interface makes setup and maintenance a snap—filter updates can be programmed to happen every several minutes, ensuring the best protection. But the real beauty of SecureTide is the set-it-and-forget-it style of deployment."

- Frank J. Ohlhorst CRN
